

New VOC-free Flux Made by ELSOLD

ELSOLD extends its product offering of water-based VOC-free fluxes by the new type ELFLUX 3003 NC, a product with a very low solid content while maintaining excellent wetting properties.

The new Flux ELFLUX 3003 NC is completely halide-free and is based upon organic components and water. In comparison to its predecessor products the solid content was further reduced to achieve an even cleaner board surface after soldering while maintaining the wetting capability and the solderability of the boards.

Further advantages for the user

- pleasant and mild in smell, almost odourless
- in-circuit testing possible without problem
- no cleaning required
- excellent soldering results with lead-free alloys
- high-reliability solder joints possible with or without inert gas
- suitable for elevated preheat temperatures

ELFLUX 3003 NC has been classified as ORM0 according to J-STD-004 and DIN EN 61190-1-1 and has passed all relevant tests per IPC-TM-650.

Standard pack sizes for the flux are 10 L and 20 L containers.

ELSOLD, a business unit of JL Goslar GmbH, manufactures in Germany and sells the flux series ELFLUX worldwide either directly or through a network of retailers and distributors. ELSOLD manufactures and sells also solder pastes and soft solder materials in the form of bars and ingots, solid and flux-cored wires and other soldering materials.
